

Future Evolution Roadmap

- **Network Swap:** Replace local mock streams inside repositories with active, asynchronous Retrofit service requests.
- **Dependency Injection:** Integrate Google Hilt to clean up manual container instantiations (AppComponent) as the dependency graph expands.
- **Pagination:** Implement Jetpack Paging 3 on the ticket list endpoints to maintain memory optimization under heavy corporate ticket loads.
- **Filtering Logic:** Extend repository flow mappings to allow fast query filters based on combinations of status, categories, and priority fields.
- **Persistent Flag Configurations:** Connect FeatureFlagsManager with local EncryptedSharedPreferences or Firebase Remote Config for remote operational toggles.
