

Package Structure

The project structure is organized by layer and component to ensure it is easily understandable for any engineer joining the team:

```
com.panini.ticketsupport/ ├── core/ — App constants and user-facing messages
                        ├── data/ | ├── remote/ — ApiService (Retrofit), RetrofitClient, DTOs
                        | |   ├── mock/ — MockTickets (simulated enterprise data for the PoC)
                        |   ├── repository/ — AuthRepository, TicketRepository
                        ├── domain/ | ├── model/ — Ticket, Priority, TicketStatus, TicketCategory
                        |   ├── featureflags/ — FeatureFlagsManager
                        |   ├── AppContainer — Manual dependency injection (Service Locator)
                        |   ├── AuthSession — Current user session
                        ├── navigation/ — AppDestinations, AppNavHost
                        ├── shared/ — ApiResult sealed class (Error/Success boundary)
                        ├── ui/
                        ├── components/ — Reusable components: AppButton, AppTextField, PaniniScaffold,
etc.
                        ├── screens/ — One folder per feature (Screen.kt + ViewModel.kt)
                        ├── theme/ — Color.kt, Theme.kt, Type.kt
```
